

Bullet Fuel Filters

Fitting Instructions

The Bullet Filter has been designed to be used as one of the following:-

- Pre-Pump Filter – Installation between the fuel tank and the fuel pump.

Or

- High Pressure Filter – Which fits into the fuel line between the fuel injection pump and the engine.

Each unit has been assembled by hand and the two body parts assembled together and tightened to the preset torque to reduce any question of fuel leakage

Installation of Bullet Filter – Application:- Pre-Filter

This design comes with either 12mm /15mm /Jic6 & Jic8 fittings

(The use of Jic6 fittings may cause a fuel flow restriction as a pre-filter).

Ensure that you have the correct unit before attempting an installation.

1/ When starting this installation, ensure that the vehicle has been left with the engine turned 'Off' for at least 30 Minutes.

2/ When Opening the fuel line one must expect spillage, although this can be reduced by either clamping the fuel feed line or draining the fuel tank.

(Every precaution should be taken to prevent injury to the installer).

3/ While installing the part, you may consider replacing the fuel hose, which may show signs of deterioration.

4/ Remember:- 'Fuel In' if from the flat end (fuel to engine is the bevelled end).

5/ Once the job is complete one must ensure that any fuel clamps have been removed and the fuel is flowing towards the fuel pump.

6/ Ensure that the installation is 100% complete.

(Check for fuel leaks prior to starting the engine.)

(Please Note:- Fuel starvation to the fuel pump will result in irreparable damage to the pump)

Installation Of Bullet Filter – Application:- High Pressure Filter

1/ As per instructions shown above.

2/ Remove old fuel filter canister, fuel spillage on this operation is minimal.

3/ Check that the connections of the new 'Bullet Filter' match the original.

4/ Bullet filter should be installed in the fuel line with the bevelled end facing towards the engine.

General Caution!

Once you have installed your new bullet motorsport filter, take a few moments to re-check your installation.

If you have used filter securing clips (Which we strongly recommend) do make sure that the fixing screws used are not fouling or have caused damage to any other part.

Please Note:- This product should be fitted by a professional mechanic / engineer, if you in any doubt do have it fitted by a professional mechanic who is familiar with the product

This product is suitable for use with unleaded and super unleaded fuels
